The aim of this study was to demonstrate the specific regional distributions of the basal forebrain cholinergic and the striatal dopaminergic systems in the rhesus monkey (*Macaca mulatta*). Two selective cholinesterase inhibitors, physostigmine and tetrahydroaminoacridine, were employed to retrogradely label cholinergic neurons in these systems and thereby to obtain distribution maps of the cholinergic system in each area. These maps were used to delineate the range of anatomical areas which have been postulated to be contained within the basal forebrain cholinergic system in rodents. Analysis of the distribution of D2 dopamine receptors on tyrosine hydroxylase-containing cells within the striatum of these monkeys indicated that the striatal dopaminergic system in the rhesus monkey is composed of the same four major anatomical divisions as in the rat and human. Finally, the regional differences in the distribution of cholinergic and dopaminergic neurons in the frontal, parietal, temporal and cingulate areas of the cerebral cortex were assessed, indicating that some functional differences among these cortical areas are linked to their differences in the distribution of these two transmitter systems.

Severe hypocalcemia after massive fluid replacement. We describe a case of severe hypocalcemia after massive fluid resuscitation in a neonate with meconium aspiration syndrome. Despite extensive investigation, a cause was not identified. Hypoproteinemia, hyperphosphatemia, and hypomagnesemia were also present. Magnesium supplementation alone was sufficient to correct hypocalcemia, and the remaining biochemical abnormalities were not persistent. The consequences of inappropriate fluid therapy in the neonate are considerable. The risk of serious complications includes profound hypocalcemia, hypokalemia, and hypomagnesemia.Q: Trouble with iter

[The relationship between serum adenylate kinase and prognosis of acute myocardial infarction]. It is suggested that the cause of death of myocardial infarction is the appearance of arrhythmias rather than myocardial ischemia. Adenosine deaminase (ADA) and adenylate kinase (AK) activities of patients with acute myocardial infarction (AMI) were studied in order to determine the prognosis of AMI. Of 53 patients admitted to a hospital in the first 48 hours, 28 had an evolving AMI and 25 were control cases. Blood samples were collected twice within the first 12 hours of admission, once after 7 days of hospitalization. ADA and AK activities were determined in serum samples taken within the first 12 hours of admission, after 7 days of hospitalization. In all subjects, the activity of AK was significantly lower in AMI cases than in control cases ( $p$  less than 0.01), but ADA activity did not differ between the 2 groups. AK activity on the 7th day after admission correlated positively with the activity on the 1st day ( $r = 0.63$ ,  $p = 8.1 \times 10^{-3}$ )

## QRational

This is a wrapper around .NET Rational which provides type safe rationals, while exposing the same API. Interfaces: QRational System.Rational The QRational type represents a rational number expressed as a floating-point value with a magnitude and a scale. Rational numbers have a finite number of decimals. For example, the number 4/3 equals 2.666666666666667, with two decimals. Classes: QRational QMethod (public) QContext (public) QConst (public) QEnvironment (public) QDecimal (public) QStringUtil (public) QVariantUtil (public) QArrayUtil (public) QValueUtil (public) QCommonUtil (public) QSystem (public) QVarArrayUtil (public) QModelUtil (public) QFieldUtil (public) QTableUtil (public) QTableAdapter (public) QDBTableUtil (public) QQTableUtil (public) QDBAdapter (public) The rational number APIs defined in the Microsoft.Quantum class library are exposed as virtual methods of the QRational class. The APIs provide a standard, consistent, API for programming against a floating-point rational. ## What's New In?

A Component is a self-contained definition of a software component. You can change the appearance of a component by changing the visual appearance of its design surface. You can customize the behavior of a component by changing its behavior in a way that reflects its structure and logic. A class is a type definition, along with its properties and methods, defining a member of a programming language. For example, the class name defines a variable's type and properties, and the methods name and implementation define its operations. In the same way that a class is a type definition, an interface is a definition of a type that does not have members. For example, the interface name defines the behavior of the type, but does not provide access to its implementation details. You can change the interface's appearance by changing the appearance of its design surface. The interface controls the behavior of a class, or a class changes the behavior of an interface, by sending messages to the interface. An object is a data structure that stores data and contains methods that operate on that data. For example, a method that creates a dialog box, or a method that displays an image or text on the screen. What is Delphi Documentation? The object-oriented Delphi Developer's Guide contains a wealth of information, design, and implementation guidelines. The object-oriented Delphi Developer's Guide is an extension of the Delphi Help system that adds documentations and topic pages to the main help topics. The help topics are based on the Delphi Help system. What is the Delphi Code Generator? The Delphi Code Generator is a script tool that generates Delphi source code. The Delphi Code Generator includes a task runner that provides control over when and how the code is generated. What is the Delphi Code Template? The Delphi Code Template is a style of code that gives you a head start on writing your own code. By using the Delphi Code Template you have an initial version of a Delphi source file that you can expand. What is the Delphi Code Template?
