## TNTRegistry Crack With Full Keygen

[Download](#)

### TNTRegistry Crack+ Serial Number Full Torrent

TNTRegistry Activation Code is a Delphi 3.0 component that replaces Borland's built-in TRegistry component. It fixes the bug in TRegistry which prevents non-administrative users from modifying the system registry under Windows NT. TNTRegistry Description: TNTRegistry is a Delphi 3.0 component that replaces Borland's built-in TRegistry component. It fixes the bug in TRegistry which prevents non-administrative users from modifying the system registry under Windows NT. How To Install: 1. Unzip TNTRegistry in to any desired folder and double-click on TNTRegistry.reg. 2. Rename it to TNTRegistry.reg (or whatever you wish) and place it in the same folder. 3. Restart Delphi or your computer. 4. If you get an error when you try to run TNTRegistry, you need to set the new registry value for "HKEY\_CURRENT\_USER\Software\Registry" and "HKEY\_LOCAL\_MACHINE\Software\Registry" at "HKEY\_CURRENT\_USER\Software\Microsoft\Synchronization". TNTRegistry Benefits: 1. A smaller memory footprint: Like all registry classes in TNTRegistry, all the data is stored in memory. This makes the registry class smaller and faster than other registry classes that store all the data in the disk. 2. No more "registry base" error: The registry classes in TNTRegistry do not store all the data into a single "base" location in the registry. Instead, all the data is stored in individual keys of the registry, so there is no "registry base" error. 3. Easy to use, very simple to understand and very easy to customize! TNTRegistry is distributed as a 3 part install package: 1. TNTRegistry.reg 2. TNTRegistry.dll 3. TNTRegistry.CHM What's New: TNTRegistry.chm: 1. Windows 2003 and Windows XP SP2: Support for Windows 2003 and Windows XP SP2. 2. Windows Vista and Windows 2008: Support for Windows Vista and Windows 2008. 3. Version 1.0.0.1 (2013-01-11): Initial release What's New in v1.1.

### TNTRegistry Crack + Download PC/Windows

This macro controls the number of macro characters to read in a multiple character string. Public KeyHook is a Delphi 3 component that allows you to use the Windows API function OpenProcessToken to hook a process token. You can use the component in two ways: 1. By calling HookProcessToken 2. By calling UnhookProcessToken To do this, you call a function such as OpenProcessToken (see MSDN). This function opens the process token for a given process. If you then call HookProcessToken, you can intercept all calls to functions (or functions in libraries) that access tokens within that process. [Un]Hooking the system registry is not a good idea, because it will probably break your machine. If you're willing to take this risk, you can use OnWindows: procedure OnWindows(SecurityDescriptor: TSecurityDescriptor); begin try if SecurityDescriptor NIL then SecurityDescriptor.Delete; except on e: Exception do raise e.ClassName + ':' + e.Message; end; end; If you want to read other areas of the registry, instead of deleting the security descriptor, you should read the TSecurityDescriptor.GetSecurityInfo directly. If you can't delete the descriptor, you should be able to get a TSecurityInfo. A: It's not a single answer, but i'm going to try to put

---

together what all you've mentioned here. First of all, you need to know which information is kept in the registry. Normally, you know this by reading it from the documentation. Look here. More specifically, you need to know what to search for. Again, look at the documentation. You need to search for "Access Control" (or something close to this). On Windows NT (unlike on Windows 95, 98 or Windows 2000), the name of a user must start with the prefix of the user's "User ID". The user's "User ID" is represented by a sequence of characters following the "User ID" name. This is described in the following list. Let's say that your user is "user1". In this case, the sequence of characters that represent the user's "User ID" is: "user1" 77a5ca646e

## TNTRegistry Free License Key Free

This component is Delphi's registry library that provides fast and reliable access to the Windows registry on NT and later. This version is optimised for performance and contains a small object oriented and thread-safe wrapper. In addition the component implements a generic read/write routine. Usage: Uses the following Windows types for registry data types. { \$IF CompilerVersion > 25 } WindowsTypes = [Windows.Win32]{ \$ELSE } WindowsTypes = [Windows.Win64]{ \$ENDIF }; { \$IFNDEF CPUX64 } { \$IF CompilerVersion > 23 } WindowsTypes = [Windows.Win32]{ \$ELSE } WindowsTypes = [Windows.Win64]{ \$ENDIF }; { \$ENDIF } { \$IFNDEF CPU386 } WindowsTypes = [Windows.Win32]{ \$ELSE } WindowsTypes = [Windows.Win64]{ \$ENDIF }; { \$ENDIF } { \$IFNDEF CPUX86 } WindowsTypes = [Windows.Win32]{ \$ELSE } WindowsTypes = [Windows.Win64]{ \$ENDIF }; { \$ENDIF } { \$IF CompilerVersion > 23 } WindowsTypes = [Windows.Win32]{ \$ELSE } WindowsTypes = [Windows.Win64]{ \$ENDIF }; { \$IF CompilerVersion > 23 } WindowsTypes = [Windows.Win32]{ \$ELSE } WindowsTypes = [Windows.Win64]{ \$ENDIF }; { \$ENDIF } { \$IFNDEF CPUX86 } WindowsTypes = [Windows.Win32]{ \$ELSE } WindowsTypes = [Windows.Win64]{ \$ENDIF }; { \$ENDIF } { \$IFNDEF CPUX64 } WindowsTypes = [Windows.Win32]{ \$ELSE } WindowsTypes = [Windows.Win64]{ \$ENDIF }; { \$ENDIF } { \$IFNDEF CPU386 }

## What's New in the?

NTTRegistry is a Delphi 3.0 component that replaces Borland's built-in TRegistry component. It fixes the bug in TRegistry which prevents non-administrative users from modifying the system registry under Windows NT. Usage: With NTTRegistry, it's easy to add a new Registry key or value, read or write a registry key or value. NTTRegistry does not contain any database to use and it doesn't need any database to be installed, It is an on-the-fly database. NTTRegistry takes all the functionality of TRegistry (itself a registry component) but does a better job in adding, deleting, reading and writing Registry keys and values. Source Code ; NTTRegistry ; ; (c) Mark Vojtek, november 1998-June 2003 ; ; Delphi Version 2.0; 6 Feb 2003 program NTTRegistry; const ADDRESS\_FLAG\_BASE = \$80000000; ADDRESS\_FLAG\_DUP = \$C0000000; HKEY\_CLASSES\_ROOT = \$80000005; HKEY\_CURRENT\_USER = \$80000004; HKEY\_LOCAL\_MACHINE = \$80000003; HKEY\_PERFORMANCE\_DATA = \$80000002; HKEY\_QUERY\_VALUE = \$80000007; HKEY\_USERS = \$80000006; REG\_BINARY = \$1; REG\_DWORD = \$4; REG\_EXPAND\_SZ = \$2; REG\_LINK = \$2000000; REG\_MULTI\_SZ = \$80000009; REG\_NONE = \$0; REG\_SZ = \$100; REG\_TEXPAND\_SZ = \$300; type { TRegistry } = class(TRegistryBase,
