Work of the presently named inventors, to the extent it is described in this background section, as well as aspects of the description that may not otherwise qualify as prior art at the time of filing, are neither expressly nor impliedly admitted as prior art against the present disclosure. A computer network can include a collection of interconnected computing devices that exchange data and share resources. For example, a computer network may include a collection of routers, each of which may interconnect a plurality of other routers and thus form a network for delivery of data packets. Routers may be associated with an Internet Protocol (IP) address. Data packets may be based on a packet header that contains source and destination IP addresses and port information. A router can include an

interface to connect the router to other networks, such as networks that may provide data to the router. The interface may include a controller that communicates with various other components of the router to, for example, process packet headers, such as to route packet headers to a correct destination. Each interface may include one or more physical links or interfaces that can be used to connect the router to other networks. Each interface may include one or more serializer-deserializer (SerDes) devices. The SerDes devices may be used to transport data packets between different integrated circuits in the router. The SerDes devices may include a serializer that serializes and deserializes data from the integrated circuit to which the SerDes device is connected, and a deserializer that deserializes and serializes data from another integrated circuit. The SerDes may use various different transmission modes, such as low-voltage differential signals, single-ended signals, differential pairs, or other configurations. The SerDes may communicate with various other components, such as other SerDes devices or other circuits, via a memory interface. The memory interface may include a memory controller that sends data to the SerDes, receives data from the SerDes, and stores data in the memory. The memory may include one or more different types of memories, including synchronous static random access memories (SRAMs) and asynchronous random access memories (ARAMs). The memory interface may include a plurality of memory banks 3da54e8ca3
